                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genes were identified by a combination of several methods: Gene prediction programs including Genscar+ (Chris Burge, http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHWM (Mark Bordovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/tdb/fgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity are named as unknown proteins. Genes without proteins are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins Genes most of their length are annotated as hypothetical proteins. Genes most of their ledy/eddy/tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RW/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/Repeatmasker.html).

It may used in the production of transgenic cells which can produce the e acquired resistance protein. Such transgenic plants cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g. bacteria, mycoplasmas, fungi, insects, nematodes, viruses,

ö
resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method provides a high level of resistance and allows a reduction in the amount of micobloide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to the treatment.

This sequence encodes a variant NIM-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method of micobicide used. Since the process involves two different methods of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to

This cDNA encodes an altered form of the Arabidopsis thaliana non-
inducible immunity-1 (NIM1) protein. Sequences shown in AAV43661 to
AAV43665 represent variants of the NIM1 cDNA. The invention provides a
chimeric gene comprising a promoter active in plants operatively linked
co a DNA molecule that encodes an altered form of the NIM1 protein. Plant
cells stably transformed with a recombinant vector comprising such a
chimeric gene have a broad spectrum of disease resistance. The altered
conting transformed with a necombinant vector comprising such a
conting transformed with an altered NIM1 gene exhibits constitutive SAR
caquired resistance (SAR) signal transduction pathway. The transgenic
conformed with an altered NIM1 gene exhibits constitutive SAR
capterssion which is higher in the transformed plants than in a wild type
plant. The products can be used for producing plants with a broad
compounds that induce constitutive immunity (CIM) phenotype
cof inducer compounds that induce constitutive immunity (CIM) phenotype
cof in plants. The inventions can be used with plants such as rice, wheat,
chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish,
chicory, paparagus, onion, garlic, eggplant, pepper, celery, carrot,
squash, pumpkin, zucchini, cucumber, appie, pear, quince, mango, banana, soybean, tobacco,
cherry, peach, nectarine, apricot, strawberry, grape, raspberry,
charto, sorghum and sugarcane. The plants produced are resistant to
charty, sarphum and sugarcane. The plants produced can be used
in agriculture.

This protein is used in a method resulting in the protection of an immunomodulated plant having a first lead of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method of microbicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to

vild-type protein. This DNA can be mutated to produce altered forms of the NIMM protein. This DNA can be mutated to produce altered forms of the NIMM protein. The invention provides a chimeric gene comprising a promoter active in plants operatively linked to a DNA molecule that cenceds an altered form of the NIMM protein. Plant cells stably transformed with a recombinant vector comprising such a chimeric gene have a broad spectrum of disease resistance. The altered NIMM proteins act as dominant-negative regulators of the systemic acquired resistance. CRAN's signal transduction pathway. The transgenic plants transformed with a natered NIMI gene exhibits constitutive SAR expression which is higher in the transformed plants with a broad spectrum disease resistance. Overexpression of NIMI minics the effects of inducer compounds that induce constitutive immunity (CIM) phenotype in plants. The inventions can be used with plants such as rice, wheat, barley, rye, corn, potato, carrot, sweet potato, sugar beet, bean, pea, chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish, spinach, asparagus, onion, garlic, eppple, pear, quince, melon, plum, cherry, peach, nectarine, apricot, strawberry, grape, raspberry, blackberry, pineapple, avocado, papaya, mango, banana, soybean, tobacco, tomato, sorghum and sugarcane. The plants produced are resistant to plant pathogens such as viruses, viroids, fungi, bacteria, insects such as aphids and lepidoptera and nematodes. The plants produced can be used in agriculture. the Arabidopsis thaliana non-inducible immunity-1 (NIM1) ×555555555555555555555555555555555

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2994
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of the NIMI (noninducible immunity) gene. It may be used to confer a broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye and corn. The NIMI gene can be used to confer universal disease susceptibility to plant cells, and their progeny. It can also be used in a screening method for identifying compounds capable of inducing broad spectrum disease resistance in plants, while the plant cells, and their progeny, can be used to isolate a gene fragment which allows expression of broad spectrum disease resistance in plants, or to incorporate the resistant trait into plant lines through breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2995 TICTCTCCGACGCCGGGAAGTITCTTTCCACCGGTGCGTTTTGTCACCGAGAAGCTCTT 3054

This represents the genomic sequence of the Arabidopsis thaliana noninducible immunity-1 (NIM1) gene. The invention provides a chimeric gene comprising a promoter active in plants operatively linked to a DNA molecule that encodes an altered form of the NIM1 protein. Plant cells stably transformed with a recombinant vector comprising such a chimeric gene have a broad spectrum of disease resistance. The altered NIM1 CC can stance (SAR) signal transduction pathway. The transgenic plants proteins act as dominant-negative regulators of the systemic acquired resistance (SAR) signal transduction pathway. The transgenic plants constitutive SAR campromed with an altered NIM1 gene exhibits constitutive SAR capprocraces and altered NIM1 gene exhibits constitutive SAR capprocraces are seistance. Overexpression of NIM1 mimics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunics the effects of inducer compounds that induce constitutive immunic, clm, peach, peach nematodes. The plants produced can be used pathogens such as viruses, aphids and lepidoptera and agriculture.

The sequence is that of the 9.9kb region of clone BAC-04 containing the NIM1 (noninducible immunity) gene. It may be used to confer a broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye and corn. The NIM1 gene can be used to confer universal disease susceptibility to plant cells, and their progeny. It can also be used in a screening method for identifying compounds capable of inducing broad spectrum disease resistance in plants, while the plant cells, and their progeny, can be used to isolate a gene fragment which allows expression of broad spectrum disease resistance in plants, or to incorporate the resistant trait
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NIM1 gene which allows activation in plant of systemic acquired resistance - useful to confer broad spectrum disease resistance in plants, specifically crop plants, e.g. rice, wheat, barley, rye and

                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a 7.5 kb genomic region which contains the acquired resistance gene NPRI. The gene may be used in the production of transgenic cells which can produce the encoded acquired resistance protein. Such transgenic plants cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g.

This sequence encodes a truncated variant NIM-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to
                                                                                                                                                                                                                                                                                                                                                                                                               NIM-1; noninducible immunity; systemic acquired resistance; SAR; pathogen; disease; protection; immunomodulated; plant; cereal; fruit; vegetable; virus; fungi; bacteria; insect; nematode; microbicide; ss.

Use of non-inducible immunity-1 gene - for transforming plants to produce transgenic plants having a broad spectrum disease resistance

Claim 12; Pages 155-159; 205pp; English.

This cDNA encodes an altered form of the Arabidopsis thaliana noninducible immunity-1 (NIMI) protein. Sequences shown in AAV43661 to
AAV43665 represent variants of the NIMI cDNA. The invention provides a
chimeric gene comprising a promoter active in plants operatively linked
to a DNA molecule that encodes an altered form of the NIMI protein. Plant
cells stably transformed with a recombinant vector comprising such a
chimeric gene have a broad spectrum of disease resistance. The altered
chimeric gene have a broad spectrum of disease resistance. The altered
continued set as dominant-negative regulators of the systemic
continued resistance (SAR) signal transduction pathway. The transgenic
plants transformed with an altered NIMI gene exhibits constitutive SAR
expression which is higher in the transformed plants than in a wild-type
continued products can be used for producing plants with a broad
spectrum disease resistance. Overexpression of NIMI mimics the effects
of inducer compounds that induce constitutive immunity (CIM) phenotype
confidence compounds that induce constitutive immunity (CIM) phenotype

This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method of micobicide used. Since the process involves two different method of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to

This cDNA encodes an altered form of the Arabidopsis thaliana non-
inducible immunity-1 (NIMI) protein. Sequences shown in AAV43661 to
AAV44565 represent variants of the NIMI bonA. The invention provides a
chimeric gene comprising a promoter active in plants operatively linked
confirmed with a recombinant vector comprising such a
cells stably transformed with a recombinant vector comprising such a
chimeric gene have a broad spectrum of disease resistance. The altered
confirmed resistance (SAR) signal transduction pathway. The transgenic
confirmed resistance (SAR) signal transduction pathway. The transgenic
confirmed resistance (SAR) signal transformed plants than in a wild-type
plants transformed with an altered NIMI gene exhibits constitutive SAR
expression which is higher in the transformed plants than in a wild-type
plant The products can be used for producing plants with a broad
confirmed disease resistance. Overexpression of NIMI mimics the effects
of inducer compounds that induce constitutive immunity (CIM) phenotype
confirmed inventions can be used with plants such as rice, wheat,
conficory, lettuce, cabbage, cauliflower, broccoli, turnip, radish,
conficory, lettuce, cabbage, cauliflower, broccoli, turnip, radish,
conficory, lettuce, apparagus, onion, garlic, egglant, peper, cance,
consumbly, pumpkin, zucchini, cucumber, apprapary grape, raspberry,
consumberry, peach, nectarine, apricot, strawberry, grape, raspberry,
consumberry, pincapple, avocado, papaya, mango, banana, soybean, tobacco,
contacto, sorghum and sugarcane. The plants produced are resistant to
consumptions and nematodes. The plants produced can be used
consumptions and lepidoptera and nematodes. The plants produced can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                     Sequence 6,
